Epicurus (ca 300 BC)

Epicurus (ca 300 BC)

Moreover, there is an infinite number of worlds, some like this world, others unlike it. For the atoms being infinite in number, as has just been proved, are borne ever further in their course. For the atoms out of which a world might arise, or by which a world might be formed, have not all been expended on one world or a finite number of worlds, whether like or unlike this one. Hence there will be nothing to hinder an infinity of worlds.

Epicurus (ca 300 BC)

And further, we must not suppose that the worlds have necessarily one and the same shape. For nobody can prove that in one sort of world there might not be contained, whereas in another sort of world there could not possibly be, the seeds out of which animals and plants arise and all the rest of the things we see.

Core-nucleated growth

Dust settles to midplane

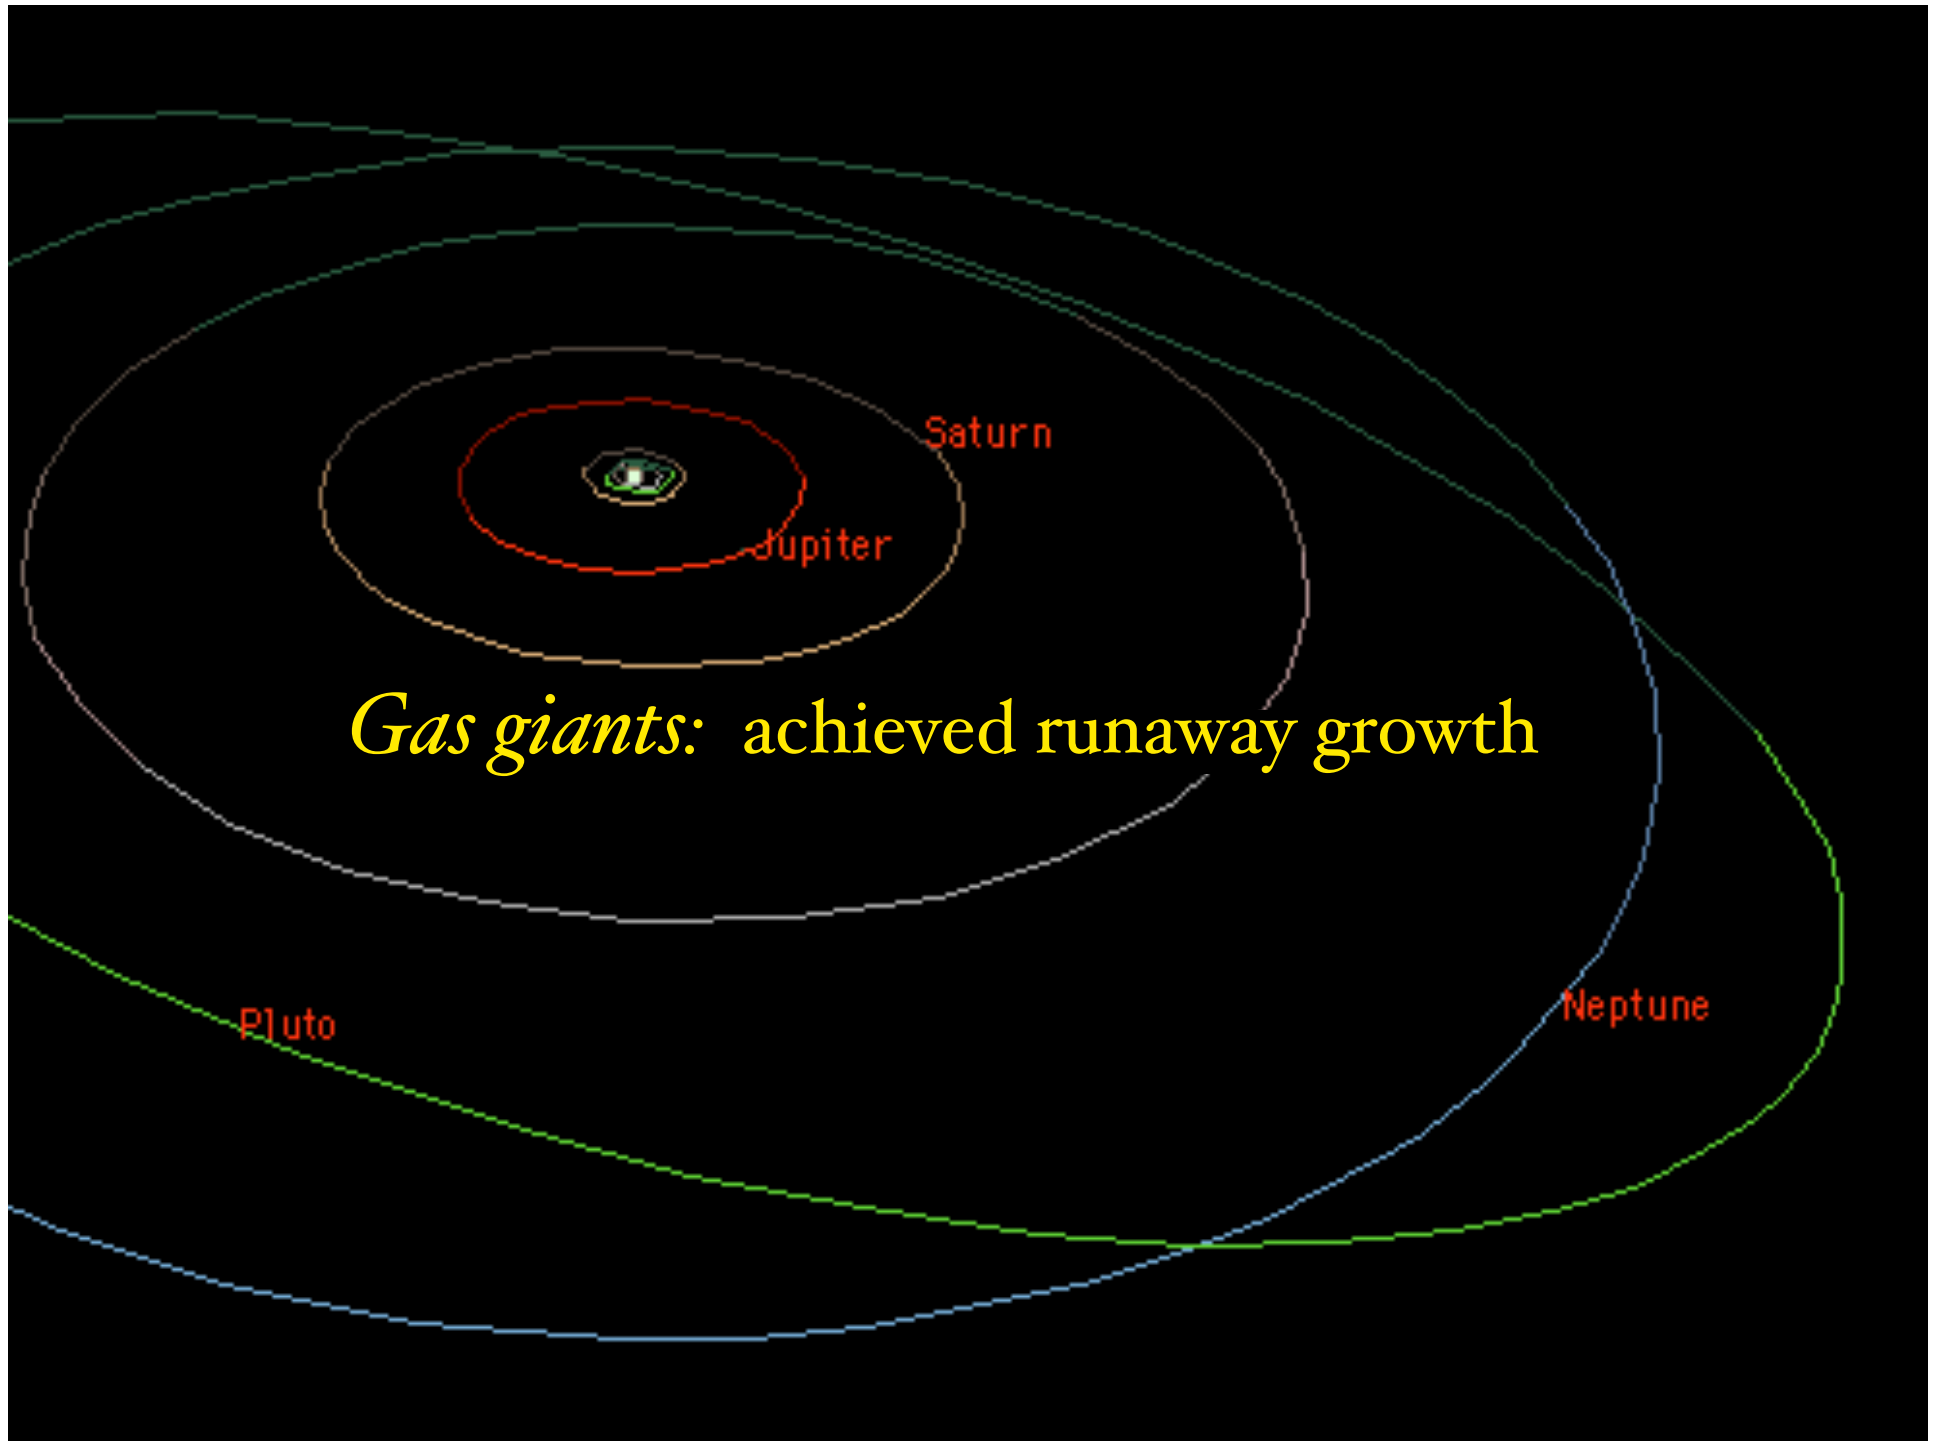

Agglomerates into ~ 1 km objects (somehow)

Growth through gravitationally-focused collisions

Begin accreting gas at $\sim 1 M_E$

Runaway accretion of gas when core reaches $\sim 10 M_E$

Rocky planets: cores too small for runaway growth

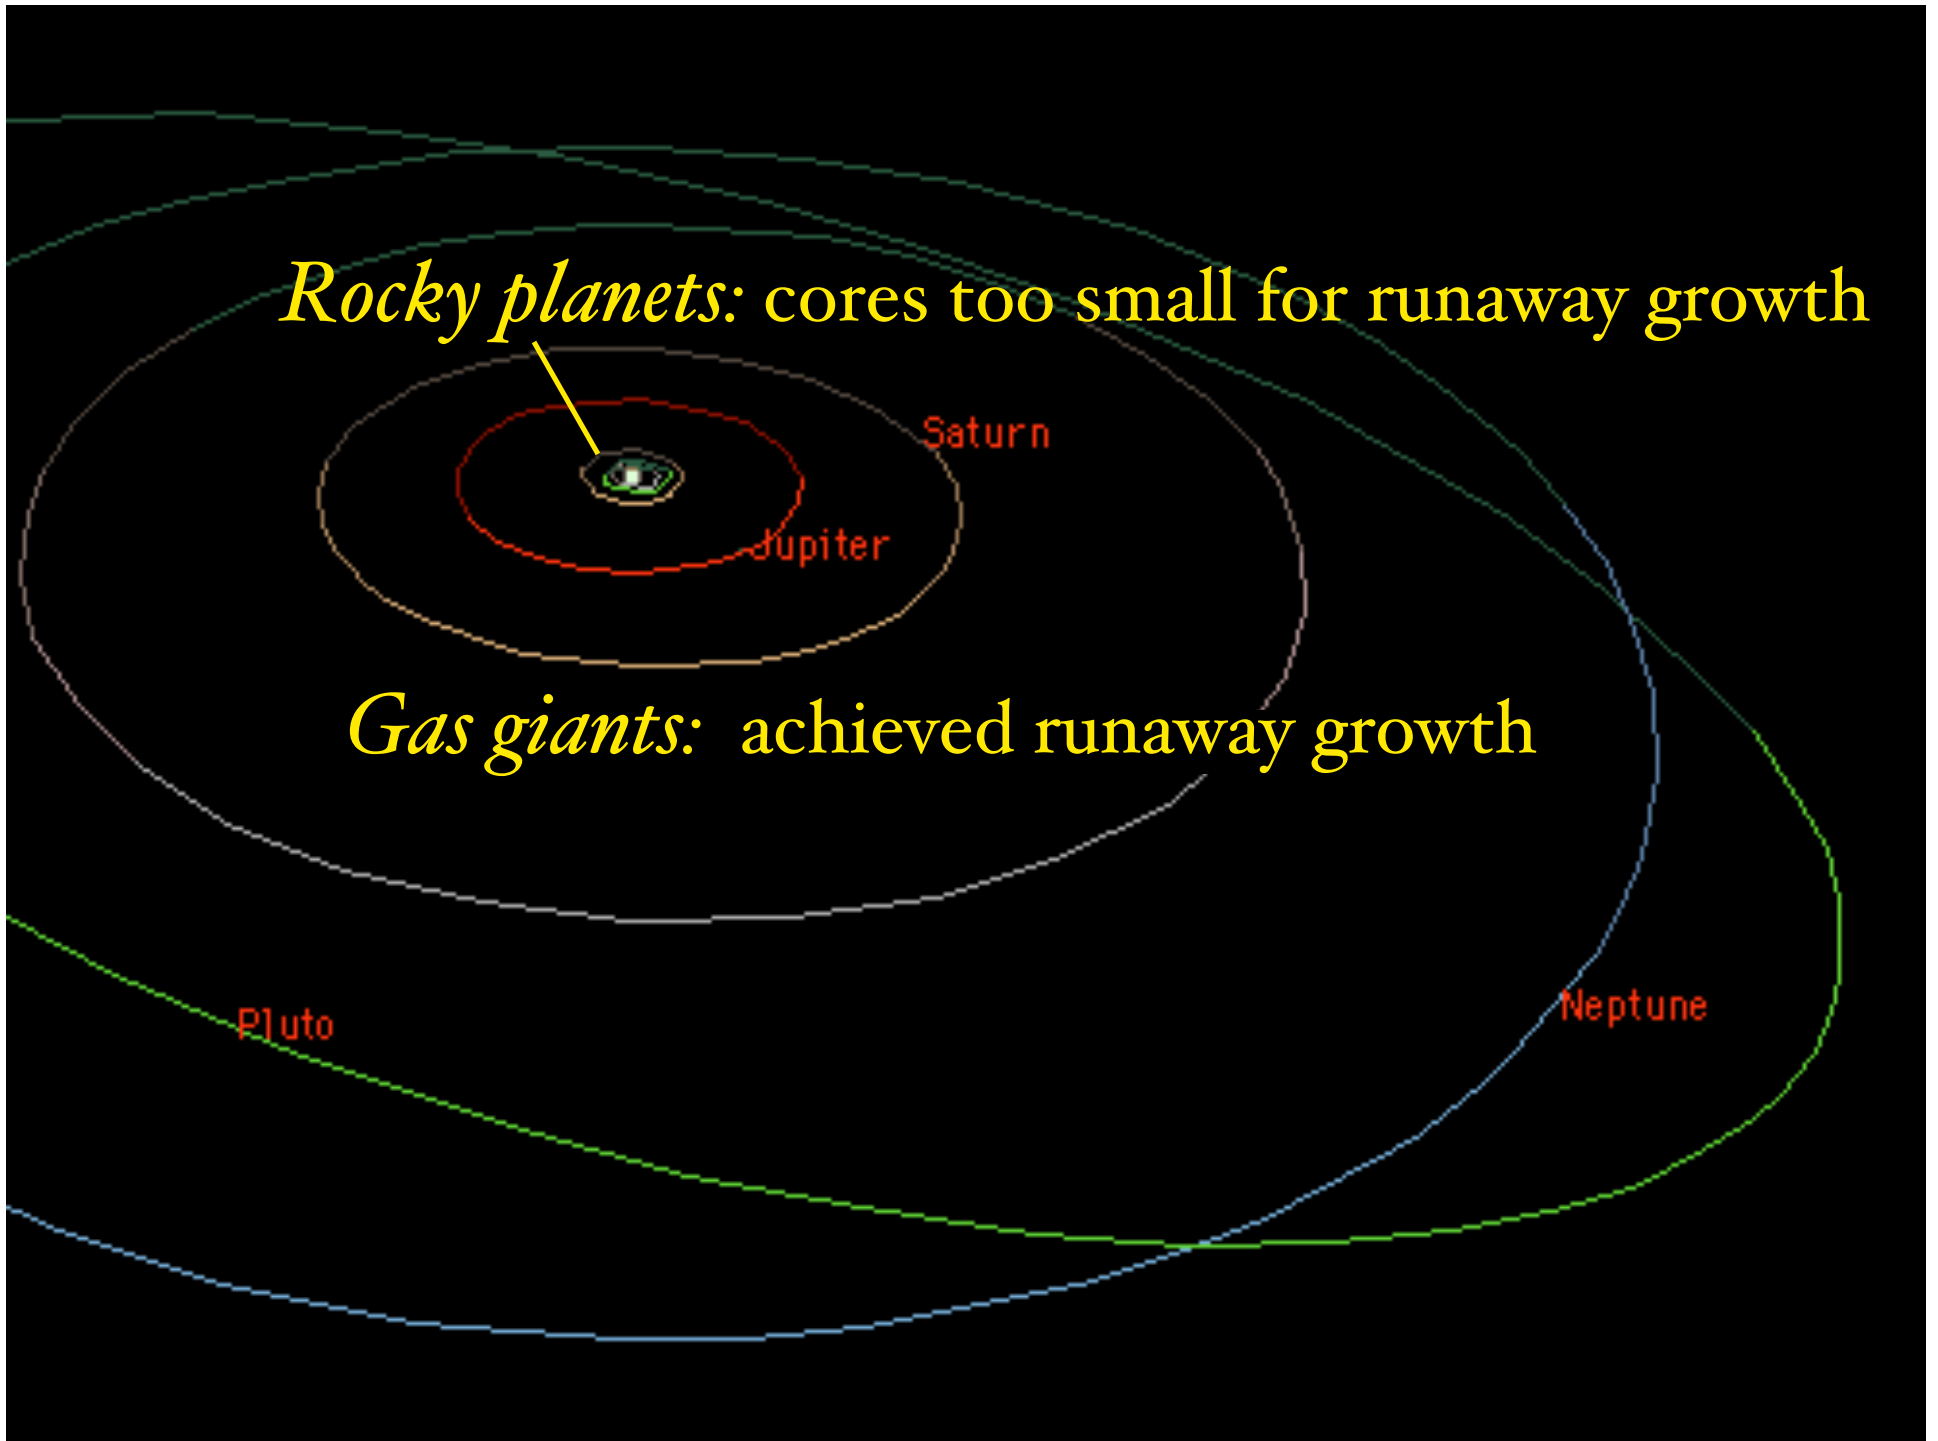

Saturn

Jupiter

Gas giants: achieved runaway growth

Pluto

Neptune

Rocky planets: cores too small for runaway growth
(large Keplerian shear, no ice available)

(large Keplerian shear, no ice available)

The diagram shows the solar system with the Sun at the center. Concentric elliptical orbits are shown in various colors. The innermost orbit is labeled 'Rocky planets' with a yellow arrow pointing to the Sun. The next orbit is labeled 'Gas giants' and contains the orbits of Jupiter and Saturn. The outermost orbit is labeled 'Ice giants' and contains the orbits of Neptune and Pluto. The labels for the planets are in red text.

Gas giants: achieved runaway growth

Ice giants:
not enough gas left
